

When Christian Faith and Genetics Meet:

A Practical Group Resource

How do we, as a Christian community, understand and respond to the issues of human genetic technologies?

The Biotechnology Research Group of the Canadian Council of Churches has developed a curriculum that considers the opportunities and risks of genetic sciences.

The resource explores questions like:

Does the science of genetics contribute to or contradict our belief that we are created in the image of God?

What ethical questions arise from the use of genetics in reproductive technologies?

How will increased knowledge of genes affect our social lives?

A group may use this curriculum by organizing a series of workshops or in a full day session.

Are you interested in being a facilitator and providing leadership in your community in using the curriculum? Are you willing to be a participant in this shared learning program? We can assist your community in exploring *When Christian Faith and Genetics Meet: A Practical Group Resource*.
